ADuM2210/ADuM2211

Dual-Channel Digital Isolators, 5 kV

FEATURES

- High isolation voltage: 5000 V rms
- Enhanced system-level ESD performance per IEC 61000-4-x
- Low power operation
  - 5 V operation
    - 1.6 mA per channel maximum at 0 Mbps to 1 Mbps
    - 3.7 mA per channel maximum at 10 Mbps
  - 3.3 V operation
    - 1.4 mA per channel maximum at 0 Mbps to 1 Mbps
    - 2.4 mA per channel maximum at 10 Mbps
- Bidirectional communication
- 3.3 V/5 V level translation
- High temperature operation: 125°C
- Default low output
- High data rate: dc to 10 Mbps (NRZ)
- Precise timing characteristics
  - 3 ns maximum pulse width distortion
  - 3 ns maximum channel-to-channel matching
- High common-mode transient immunity: >25 kV/µs
- 16-lead SOIC wide body package version (RW-16)
- 16-lead SOIC wide body enhanced creepage version (RI-16)
- Safety and regulatory approvals (16-Lead-SOIC_IC/16-Lead-SOIC_W)
  - UL 1577
    - V_{ISO}= 5000 V rms for 1 minute
  - IEC/EN/CSA 62368-1
  - IEC/CSA 60601-1
  - IEC/CSA 61010-1
  - CQC GB4943.1
  - DIN EN IEC 60747-17 (VDE 0884-17)
    - V_{IORM} = 645 V peak
- AEC-Q100 qualified for automotive applications

APPLICATIONS

- General-purpose, high voltage, multichannel isolation
- Medical equipment
- Power supplies
- RS-232/RS-422/RS-485 transceiver isolation
- Hybrid electric vehicles, battery monitors, and motor drives

GENERAL DESCRIPTION

The ADuM2210/ADuM2211[1] are 2-channel digital isolators based on Analog Devices, Inc., *i*Coupler® technology. Combining high speed CMOS and monolithic air core transformer technology, these isolation components provide outstanding performance characteristics that are superior to alternatives such as optocoupler devices.

By avoiding the use of LEDs and photodiodes, *i*Coupler devices remove the design difficulties commonly associated with optocouplers.

Typical optocoupler concerns regarding uncertain current transfer ratios, nonlinear transfer functions, and temperature and lifetime effects are eliminated with the simple *i*Coupler digital interfaces and stable performance characteristics. The need for external drivers and other discrete components is eliminated with these *i*Coupler products. Furthermore, *i*Coupler devices run at one-tenth to one-sixth the power of optocouplers at comparable signal data rates.

The ADuM2210/ADuM2211 isolators provide two independent isolation channels in a variety of channel configurations and data rates (see the Ordering Guide). They operate with the supply voltage of either side ranging from 3.0 V to 5.5 V, providing compatibility with lower voltage systems as well as enabling voltage translation functionality across the isolation barrier. The ADuM2210W and ADuM2211W are automotive grade versions.

Similar to the ADuM3200/ADuM3201 isolators, the ADuM2210/ADuM2211 isolators contain various circuit and layout enhancements to provide increased capability relative to system-level IEC 61000-4-x testing (ESD, burst, and surge). The precise capability in these tests for either the ADuM3200/ ADuM3201 or ADuM2210/ADuM2211 products is strongly determined by the design and layout of the user's board or module. For more information, see the AN-793 Application Note, *ESD/Latch-Up Considerations with iCoupler Isolation Products*.

[1] Protected by U.S. Patents 5,952,849; 6,873,065; 6,903,578; and 7,075,329. Other patents pending.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS—5 V OPERATION

All voltages are relative to their respective ground. 4.5 V ≤ V_{DD1} ≤ 5.5 V, 4.5 V ≤ V_{DD2} ≤ 5.5 V. All minimum/maximum specifications apply over the entire recommended operation range, −40°C ≤ T_A ≤ 125°C, unless otherwise noted. All typical specifications are at T_A = 25°C, V_{DD1} = V_{DD2} = 5 V.

Refresh Period	T_r		1.6		μs	

SPECIFICATIONS

[1] I_{Ox} is the Channel x output current, where x = A or B, V_{IxH} is the input side logic high, and V_{IxL} is the input side logic low.

[2] |CM| is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O > 0.8\ V_{DDx}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

ELECTRICAL CHARACTERISTICS—3.3 V OPERATION

All voltages are relative to their respective ground. 3.0 V ≤ V_{DD1} ≤ 3.6 V, 3.0 V ≤ V_{DD2} ≤ 3.6 V. All minimum/maximum specifications apply over the entire recommended operation range, −40°C ≤ T_A ≤ 125°C, unless otherwise noted. All typical specifications are at T_A = 25°C, V_{DD1} = V_{DD2} = 3.3 V.

Parameter	Symbol	Value	Unit	Conditions
Tracking Resistance (Comparative Tracking Index)[3]	CTI	>400	V	DIN IEC 112/VDE 0303 Part 1
Material Group		II		Material Group (DIN VDE 0110, 1/89, Table 1)

[1] In accordance with IEC 62368-1/IEC 60601-1 guidelines for the measurement of creepage and clearance distances for a pollution degree of 2 and altitudes ≤2000 m.

[2] Consideration must be given to pad layout to ensure the minimum required distance for clearance is maintained.

[3] CTI rating for the ADuM2210/ADuM2211 RI-16-2/RW-16 is >400 V and a Material Group II isolation group.

DIN EN IEC 60747-17 (VDE 0884-17) INSULATION CHARACTERISTICS

These isolators are suitable for reinforced electrical isolation only within the safety limit data. Maintenance of the safety data is ensured by means of protective circuits. Note that the asterisk (*) branded on packages denotes DIN EN IEC 60747-17 (VDE 0884-17) approval.

Table 16.

Description	Test Conditions/Comments	Symbol	Characteristic	Unit
Installation Classification per DIN VDE 0110				
≤ 300 V rms			I to IV	
≤ 450 V rms			I to II	
≤ 600 V rms			I to II	
Climatic Classification			40/125/21	
Pollution Degree (DIN VDE 0110, Table 1)			2	
Maximum Repetitive Isolation Voltage		V_{IORM}	645	V peak
Maximum Working Insulation Voltage		V_{IOWM}	456	V rms
Input-to-Output Test Voltage, Method B1	V_{IORM} × 1.875 = $V_{pd(m)}$, 100% production test, t_m = 1 sec, partial discharge < 5 pC	$V_{pd(m)}$	1209	V peak
Input-to-Output Test Voltage, Method A				
After Environmental Tests Subgroup 1	V_{IORM} × 1.6 = $V_{pd(m)}$, t_m = 60 sec, partial discharge < 5 pC	$V_{pd(m)}$	1032	V peak
After Input and/or Safety Test Subgroup 2 and Subgroup 3	V_{IORM} × 1.2 = $V_{pd(m)}$, t_m = 60 sec, partial discharge < 5 pC	$V_{pd(m)}$	774	V peak
Maximum Transient Isolation Voltage	V_{TEST} = 1.2 × V_{IOTM}, t =1s (100% production)	V_{IOTM}	6000	V peak
Maximum Impulse Voltage	Surge voltage in air, waveform per IEC 61000-4-5	V_{IMP}	6000	V peak
Maximum Surge Isolation Voltage	V_{TEST} ≥ 1.3 × V_{IMP} (sample test), tested in oil, waveform per IEC 61000-4-5	V_{IOSM}	10000	V peak
Safety-Limiting Values	Maximum value allowed in the event of a failure; see Figure 3			
Case Temperature		T_S	150	°C
Side 1 Current		I_{S1}	265	mA
Side 2 Current		I_{S2}	335	mA
Insulation Resistance at T_S	V_{IO} = 500 V	R_S	$>10^9$	Ω

SPECIFICATIONS

RECOMMENDED OPERATING CONDITIONS

Table 17.

Parameter	Symbol	Min	Max	Unit
Operating Temperature	T_A	−40	+125	°C
Supply Voltages[1]	V_{DD1}, V_{DD2}	3.0	5.5	V
Input Signal Rise and Fall Times			1.0	ms

[1] All voltages are relative to their respective ground.

ABSOLUTE MAXIMUM RATINGS

Table 18.

Parameter	Rating
Storage Temperature (T_{ST})	−65°C to +150°C
Ambient Operating Temperature (T_A)	−40°C to +125°C
Supply Voltage (V_{DD1}, V_{DD2})[1]	−0.5 V to +7.0 V
Input Voltage (V_{IA}, V_{IB})[1, 2]	−0.5 V to V_{DDI} + 0.5 V
Output Voltage (V_{OA}, V_{OB})[1, 2]	−0.5 V to V_{DDO} + 0.5 V
Average Output Current per Pin[3]	
Side 1 (I_{O1})	−18 mA to +18 mA
Side 2 (I_{O2})	−22 mA to +22 mA
Common-Mode Transients[4]	−100 kV/µs to +100 kV/µs

1 All voltages are relative to their respective ground.

2 V_{DDI} and V_{DDO} refer to the supply voltages on the input and output sides of a given channel, respectively. See the PCB Layout section.

3 See Figure 3 for maximum rated current values for various temperatures.

4 Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the Absolute Maximum Rating can cause latch-up or permanent damage.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

MAXIMUM CONTINUOUS WORKING VOLTAGE

Table 19. Maximum Continuous Working Voltage[1]

Parameter	Max	Unit	Constraint
AC Voltage			
Bipolar Waveform	645	V peak	Reinforced insulation rating as per IEC 60747-17 (VDE 0884-17)

1 Refers to continuous voltage magnitude imposed across the isolation barrier. See the Insulation Lifetime section for more details

APPLICATIONS INFORMATION

PCB LAYOUT

The ADuM2210/ADuM2211 digital isolator requires no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 12). Bypass capacitors are most conveniently connected between Pin 1 and Pin 3 for V_{DD1} and between Pin 14 and Pin 16 for V_{DD2}. The capacitor value should be between 0.01 µF and 0.1 µF. The total lead length between both ends of the capacitor and the input power supply pin should not exceed 20 mm. Bypassing between Pin 3 and Pin 7 and between Pin 9 and Pin 14 should be considered unless the ground pair on each package side is connected close to the package.

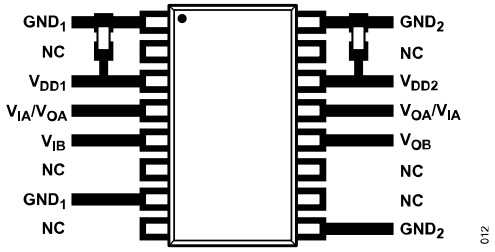

Figure 12. Recommended Printed Circuit Board Layout

In applications involving high common-mode transients, care should be taken to ensure that board coupling across the isolation barrier is minimized. Furthermore, the board layout should be designed such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this could cause voltage differentials between pins exceeding the Absolute Maximum Ratings of the device, thereby leading to latch-up or permanent damage.

See the AN-1109 Application Note for board layout guidelines.

PROPAGATION DELAY-RELATED PARAMETERS

Propagation delay is a parameter that describes the length of time it takes for a logic signal to propagate through a component. The propagation delay to a logic low output can differ from the propagation delay to logic high.

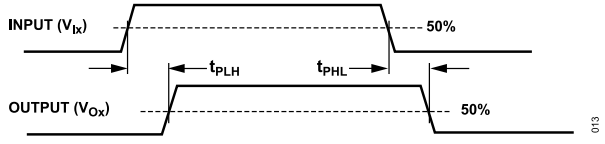

Figure 13. Propagation Delay Parameters

Pulse width distortion is the maximum difference between these two propagation delay values and is an indication of how accurately the input signal's timing is preserved.

Channel-to-channel matching refers to the maximum amount the propagation delay differs among channels within a single ADuM2210/ADuM2211 component.

Propagation delay skew refers to the maximum amount the propagation delay differs among multiple ADuM2210/ADuM2211 components operated under the same conditions.

DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow (~1 ns) pulses to be sent via the transformer to the decoder. The decoder is bistable and is, therefore, either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than ~1 µs, a periodic set of refresh pulses indicative of the correct input state is sent to ensure dc correctness at the output. If the decoder receives no internal pulses for more than approximately 5 µs, the input side is assumed to be without power or nonfunctional; in which case, the isolator output is forced to a default state (see Table 20 and Table 21) by the watchdog timer circuit.

The limitation on the ADuM2210/ADuM2211 magnetic field immunity is set by the condition in which induced voltage in the transformer receiving coil is large enough to either falsely set or reset the decoder. The following analysis defines the conditions under which this can occur. The 3.3 V operating condition of the ADuM2210/ADuM2211 is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude greater than 1.0 V. The decoder has a sensing threshold at about 0.5 V, therefore establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt)\Sigma\pi r_n^2;\ n = 1, 2, \ldots, N \quad (1)$$

where:
β is the magnetic flux density (gauss).
N is the number of turns in the receiving coil.
r_n is the radius of the n^{th} turn in the receiving coil (cm).

Given the geometry of the receiving coil in the ADuM2210/ADuM2211 and an imposed requirement that the induced voltage be at most 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 14.

APPLICATIONS INFORMATION

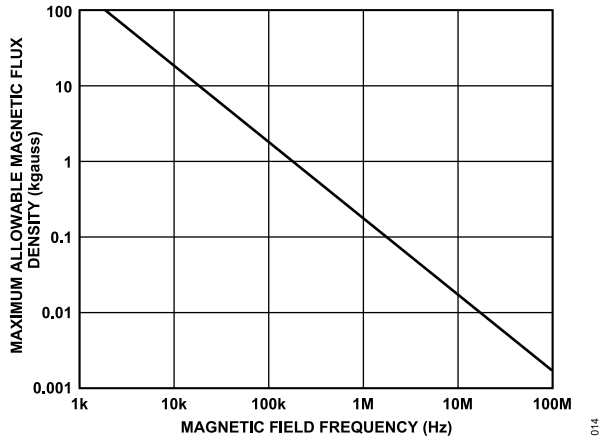

Figure 14. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is about 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event were to occur during a transmitted pulse (and was of the worst-case polarity), it would reduce the received pulse from >1.0 V to 0.75 V—still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances away from the ADuM2210/ADuM2211 transformers. Figure 15 expresses these allowable current magnitudes as a function of frequency for selected distances. As can be seen, the ADuM2210/ADuM2211 is immune and can be affected only by extremely large currents operated at high frequency and very close to the component. For the 1 MHz example noted previously, one would have to place a 0.5 kA current 5 mm away from the ADuM2210/ADuM2211 to affect operation of the component.

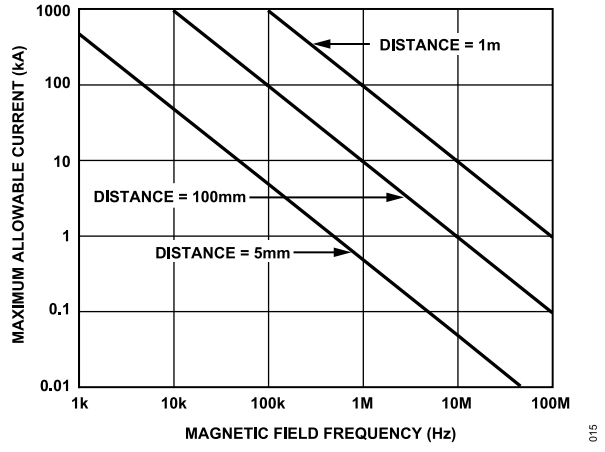

Figure 15. Maximum Allowable Current for Various Current-to-ADuM2210/ADuM2211 Spacings

Note that at combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces can induce sufficiently large error voltages to trigger the thresholds of succeeding circuitry. Care should be taken in the layout of such traces to avoid this possibility.

POWER CONSUMPTION

The supply current at a given channel of the ADuM2210/ADuM2211 isolator is a function of the supply voltage, the channel's data rate, and the channel's output load.

For each input channel, the supply current is given by

$$I_{DDI} = I_{DDI\,(Q)} \quad f \leq 0.5f_r \tag{2}$$

$$I_{DDI} = I_{DDI\,(D)} \times (2f - f_r) + I_{DDI\,(Q)} \quad f > 0.5f_r \tag{3}$$

For each output channel, the supply current is given by

$$I_{DDO} = I_{DDO\,(Q)} \quad f \leq 0.5f_r \tag{4}$$

$$I_{DDO} = (I_{DDO\,(D)} + (0.5 \times 10^{-3}) \times C_L \times V_{DDO}) \times (2f - f_r) + I_{DDO\,(Q)} \tag{5}$$

$$f > 0.5f_r \tag{6}$$

where:
$I_{DDI\,(D)}$, $I_{DDO\,(D)}$ are the input and output dynamic supply currents per channel (mA/Mbps).
C_L is the output load capacitance (pF).
V_{DDO} is the output supply voltage (V).
f is the input logic signal frequency (MHz, half of the input data rate, NRZ signaling).
f_r is the input stage refresh rate (Mbps).
$I_{DDI\,(Q)}$, $I_{DDO\,(Q)}$ are the specified input and output quiescent supply currents (mA).

To calculate the total I_{DD1} and I_{DD2}, the supply currents for each input and output channel corresponding to I_{DD1} and I_{DD2} are calculated and totaled. Figure 6 and Figure 7 provide per-channel supply currents as a function of data rate for an unloaded output condition. Figure 8 provides per-channel supply current as a function of data rate for a 15 pF output condition. Figure 9 through Figure 11 provide total I_{DD1} and I_{DD2} as a function of data rate for ADuM2210/ADuM2211 channel configurations.

INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation. In addition to the testing performed by the regulatory agencies, Analog Devices carries out an extensive set of evaluations to determine the lifetime of the insulation structure within the ADuM2210/ADuM2211.

Analog Devices performs accelerated life testing using voltage levels higher than the rated continuous working voltage. Acceleration factors for several operating conditions are determined. These factors allow calculation of the time to failure at the actual working voltage. The values shown in Table 19 summarize the maximum continuous working voltages as per IEC 60747-17. Operation at

APPLICATIONS INFORMATION

working voltages higher than the service life voltage listed leads to premature insulation failure.

OUTLINE DIMENSIONS

AUTOMOTIVE PRODUCTS

The ADuM2210W/ADuM2211W models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
