

ADuM6210/ADuM6211/ADuM6212

Dual-Channel Isolators with Integrated DC-to-DC Converters

FEATURES

- ▶ isoPower integrated, isolated dc-to-dc converter
- ▶ Regulated 3.135 V to 5.25 V output
- ▶ Up to 150 mW output power
- ▶ Dual dc-to-100 Mbps (NRZ) signal isolation channels
- ▶ Soft start power supply
- ▶ 20-lead SSOP package with 5.3 mm creepage
- ▶ Supports SPI up to 15 MHz
- ▶ High temperature operation: 105°C
- ▶ High common-mode transient immunity: >25 kV/μs
- ▶ Safety and regulatory approvals
 - ▶ UL 1577
 - ▶ $V_{ISO} = 3750$ V rms for 1 minute
 - ▶ IEC/CSA 62368-1
 - ▶ IEC/CSA 61010-1
 - ▶ DIN EN IEC 60747-17 (VDE 0884-17) (pending)
 - ▶ $V_{IORM} = 600$ V peak

APPLICATIONS

- ▶ RS-232 transceivers
- ▶ Power supply start-up bias and gate drives
- ▶ Isolated sensor interfaces
- ▶ Industrial PLCs

GENERAL DESCRIPTION

The ADuM6210/ADuM6211/ADuM6212¹ are dual-channel digital isolators with isoPower®, an integrated, isolated dc-to-dc converter. Based on the Analog Devices, Inc., iCoupler® technology, the dc-to-dc converter provides regulated, isolated power that is adjustable between 3.135 V and 5.25 V. Input supply voltages can range from slightly below the required output to significantly higher. Popular voltage combinations and their associated power levels are shown in Table 2.

The ADuM6210/ADuM6211/ADuM6212 eliminate the need for a separate, isolated dc-to-dc converter in low power, isolated designs. The iCoupler chip-scale transformer technology is used for isolated logic signals and for the magnetic components of the dc-to-dc converter. The result is a small form factor, total isolation solution.

isoPower uses high frequency switching elements to transfer power through its transformer. Take special care during printed circuit board (PCB) layout to meet emissions standards. See the AN-0971 Application Note for board layout recommendations.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS—5 V PRIMARY INPUT SUPPLY/5 V SECONDARY ISOLATED SUPPLY

All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = V_{DD2} = V_{DDP} = 5\text{ V}$, V_{SEL} resistor network: $R_1 = 10\text{ k}\Omega$, $R_2 = 30.9\text{ k}\Omega$ between V_{ISO} and GND_{ISO} . Minimum/maximum specifications apply over the entire recommended operation range, which is $4.5\text{ V} \leq V_{DD1}, V_{DD2}, V_{DDP} \leq 5.5\text{ V}$ and $-40^\circ\text{C} \leq T_A \leq +105^\circ\text{C}$, unless otherwise noted. Switching specifications are tested with $C_L = 15\text{ pF}$ and CMOS signal levels, unless otherwise noted.

Common-Mode Transient Immunity ¹	CM	25	35		kV/ μs	$V_{Ix} = V_{DD1}$ or V_{ISO} , $V_{CM} = 1000 \text{ V}$, transient magnitude = 800 V
Refresh Rate	t_r		1.6		μs	

¹ |CM| is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_{Ox} > 0.8 \times V_{DD1}$ or $0.8 \times V_{ISO}$ for a high input or $V_{Ox} < 0.8 \times V_{DD1}$ or $0.8 \times V_{ISO}$ for a low input. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS—3.3 V PRIMARY INPUT SUPPLY/3.3 V SECONDARY ISOLATED SUPPLY

All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = V_{DD2} = V_{DDP} = 3.3\text{ V}$, V_{SEL} resistor network: $R_1 = 10\text{ k}\Omega$, $R_2 = 16.9\text{ k}\Omega$ between V_{ISO} and GND_{ISO} . Minimum/maximum specifications apply over the entire recommended operation range, which is $3.135\text{ V} \leq V_{DD1}, V_{DD2}, V_{DDP} \leq 3.6\text{ V}$, and $-40^\circ\text{C} \leq T_A \leq +105^\circ\text{C}$, unless otherwise noted. Switching specifications are tested with $C_L = 15\text{ pF}$ and CMOS signal levels, unless otherwise noted.

The digital isolator channels and the power section work independently, and under the operating voltages in this section, there may not be sufficient current from the V_{ISO} to run both data channels at the maximum data rate. Verify that the application is within the power capability of V_{ISO} if that supply is providing power to V_{DD2} .

PACKAGE CHARACTERISTICS

Table 15. Thermal and Isolation Characteristics

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Resistance (Input to Output) ¹	R _{I-O}		10 ¹²		Ω	
Capacitance (Input to Output) ¹	C _{I-O}		2.2		pF	f = 1 MHz
Input Capacitance ²	C _I		4.0		pF	
IC Junction-to-Ambient Thermal Resistance	θ _{JA}		50		°C/W	Thermocouple located at center of package underside, test conducted on 4-layer board with thin traces ³

¹ The device is considered a 2-terminal device: Pin 1 through Pin 10 are shorted together; and Pin 11 through Pin 20 are shorted together.

² Input capacitance is from any input data pin to ground.

³ See the [Thermal Analysis](#) section for thermal model definitions.

REGULATORY INFORMATION

The ADuM6210/ADuM6211/ADuM6212 certification approvals are listed in [Table 16](#).

Table 16.

UL	CSA	VDE (Pending)
1577 ¹ Single Protection, 3750 V rms	IEC/CSA 62368-1 Basic insulation, 530 V rms Reinforced insulation, 265 V rms IEC/CSA 61010-1 Basic insulation, 300 V rms, overvoltage category II Reinforced insulation, 150 V rms	DIN EN IEC 60747-17 (VDE 0884-17) ² Reinforced insulation, 600 V peak
File E214100	File No. 205078	Certificate No. (pending)

¹ In accordance with UL 1577, each ADuM6210/ADuM6211/ADuM6212 is proof tested by applying an insulation test voltage ≥4500 V rms for 1 second (current leakage detection limit = 10 μA).

² In accordance with DIN EN IEC 60747-17 (VDE 0884-17), each ADuM6210/ADuM6211/ADuM6212 is proof tested by applying an insulation test voltage ≥1125 V peak for 1 second (partial discharge detection limit = 5 pC). The * marking branded on the component designates DIN EN IEC 60747-17 (VDE 0884-17) approval.

INSULATION AND SAFETY-RELATED SPECIFICATIONS

Table 17. Critical Safety-Related Dimensions and Material Properties

Parameter	Symbol	Value	Unit	Test Conditions/Comments
Rated Dielectric Insulation Voltage		3750	V rms	1-minute duration
Minimum External Air Gap (Clearance) ^{1, 2}	L(I01)	5.3	mm	Measured from input terminals to output terminals, shortest distance through air
Minimum External Tracking (Creepage) ¹	L(I02)	5.3	mm	Measured from input terminals to output terminals, shortest distance path along body
Minimum Internal Gap (Internal Clearance)		18	μm	Distance through insulation
Tracking Resistance (Comparative Tracking Index) ³	CTI	>600	V	DIN IEC 112/VDE 0303, Part 1
Material Group		I		Material group (DIN VDE 0110, 1/89, Table 1)

¹ In accordance with IEC 62368-1/IEC 60601-1 guidelines for the measurement of creepage and clearance distances for a pollution degree of 2 and altitudes ≤2000 m.

² Consideration must be given to pad layout to ensure the minimum required distance for clearance is maintained.

³ CTI rating for the ADuM6210/ADuM6211/ADuM6212 is >600 V and a Material Group I isolation group.

SPECIFICATIONS

DIN EN IEC 60747-17 (VDE 0884-17) INSULATION CHARACTERISTICS

These isolators are suitable for reinforced electrical isolation only within the safety limit data. Maintenance of the safety data is ensured by the protective circuits. The asterisk (*) marking on packages denotes DIN EN IEC 60747-17 (VDE 0884-17) approval.

SPECIFICATIONS

RECOMMENDED OPERATING CONDITIONS

Table 19.

Parameter	Symbol	Min	Max	Unit
Operating Temperature ¹	T_A	-40	+105	°C
Supply Voltages ²				
V_{DDP} at $V_{ISO} = 3.135\text{ V to }3.6\text{ V}$	V_{DDP}	3.135	5.5	V
V_{DDP} at $V_{ISO} = 4.5\text{ V to }5.5\text{ V}$		4.5	5.5	V
V_{DD1}, V_{DD2}	V_{DD1}, V_{DD2}	3.135	5.5	V

¹ Operation at 105°C requires reduction of the maximum load current as specified in Table 20.

² Each voltage is relative to its respective ground.

ABSOLUTE MAXIMUM RATINGS

Ambient temperature = 25°C, unless otherwise noted.

Table 20.

Parameter	Rating
Storage Temperature Range (T_{ST})	-55°C to +150°C
Ambient Operating Temperature Range (T_A)	-40°C to +105°C
Supply Voltages (V_{DDP} , V_{DD1} , V_{DD2} , V_{ISO}) ¹	-0.5 V to +7.0 V
V_{ISO} Supply Current ² $T_A = -40^\circ\text{C}$ to $+105^\circ\text{C}$	30 mA
Input Voltage (V_{IA} , V_{IB} , $PDIS$, V_{SEL}) ^{1, 3}	-0.5 V to $V_{DD1} + 0.5$ V
Output Voltage (V_{OA} , V_{OB}) ^{1, 3}	-0.5 V to $V_{DDO} + 0.5$ V
Average Output Current Per Data Output Pin ⁴	-10 mA to +10 mA
Common-Mode Transients ⁵	-100 kV/ μs to +100 kV/ μs

¹ All voltages are relative to their respective ground.

² The V_{ISO} provides current for dc and dynamic loads on the V_{ISO} I/O channels. This current must be included when determining the total V_{ISO} supply current. For ambient temperatures between 85°C and 105°C, maximum allowed current is reduced.

³ V_{DD1} and V_{DDO} refer to the supply voltages on the input and output sides of a given channel, respectively. See the [PCB Layout](#) section.

⁴ See [Figure 2](#) for the maximum rated current values for various temperatures.

⁵ Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum ratings may cause latch-up or permanent damage.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Table 21. Maximum Continuous Working Voltage¹

Parameter	Max	Unit	Applicable Certification
AC Voltage			
Bipolar Waveform	600	V peak	Reinforced insulation rating per IEC 60747-17

¹ Refers to the continuous voltage magnitude imposed across the isolation barrier. See the [Insulation Lifetime](#) section for more information.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

NOTES
 1. PINS LABELED NC CAN BE ALLOWED TO FLOAT, BUT IT IS BETTER TO CONNECT THESE PINS TO GROUND. AVOID ROUTING HIGH SPEED SIGNALS THROUGH THESE PINS BECAUSE NOISE COUPLING MAY RESULT.

Figure 3. ADuM6210 Pin Configuration

Table 22. ADuM6210 Pin Function Descriptions

Pin No.	Mnemonic	Description
1	V _{DD1}	Power Supply for the Side 1 Logic Circuits of the Device. It is independent of V _{DDP} and can operate between 3.135 V and 5.5 V.
2, 5, 6, 10	GND _P	Ground Reference for Isolator Side 1. All of these pins are internally connected, and it is recommended that all GND _P pins be connected to a common ground.
3	V _{IA}	Logic Input A.
4	V _{IB}	Logic Input B.
7, 14	NC	No Connect. Pins labeled NC can be allowed to float, but it is better to connect these pins to ground. Avoid routing high speed signals through these pins because noise coupling may result.
8	PDIS	Power Disable. When this pin is tied to a logic low, the power converter is active; when tied to a logic high, the power supply enters a low power standby mode.
9	V _{DDP}	Primary isoPower Supply Voltage, 3.135 V V to 5.5 V.
11, 15, 16, 19	GND _{ISO}	Ground Reference for Isolator Side 2. All of these pins are internally connected, and it is recommended that all GND _{ISO} pins be connected to a common ground.
12	V _{ISO}	Secondary Supply Voltage Output for External Loads, 3.3 V (V _{SEL} Low) or 5.0 V (V _{SEL} High).
13	V _{SEL}	Output Voltage Select. Provide a thermally matched resistor network between V _{ISO} and GND _{ISO} to divide the required output voltage to match the 1.25 V reference voltage. V _{ISO} voltage can be programmed up to 20% higher or 75% lower than V _{DDP} but must be within the allowed output voltage range.
17	V _{OB}	Logic Output B.
18	V _{OA}	Logic Output A.
20	V _{DD2}	Power Supply for the Side 2 Logic Circuits of the Device. It is independent of V _{ISO} and can operate between 3.135 V and 5.5 V.

APPLICATIONS INFORMATION

The dc-to-dc converter section of the ADuM6210/ADuM6211/ADuM6212 works on principles that are common to most modern power supplies. It has a split controller architecture with isolated pulse-width modulation (PWM) feedback. V_{DDP} power is supplied to an oscillating circuit that switches current into a chip-scale air core transformer. Power transferred to the secondary side is rectified and regulated to a value between 3.135 V and 5.25 V, depending on the setpoint supplied by an external voltage divider (see Equation 1). The secondary (V_{ISO}) side controller regulates the output by creating a PWM control signal that is sent to the primary (V_{DDP}) side by a dedicated *iCoupler* data channel. The PWM modulates the oscillator circuit to control the power being sent to the secondary side. Feedback allows for significantly higher power and efficiency.

$$V_{ISO} = 1.25 V \frac{(R1 + R2)}{R1} \tag{1}$$

where:

$R1$ is a resistor between V_{SEL} and GND_{ISO} .

$R2$ is a resistor between V_{SEL} and V_{ISO} .

Because the output voltage can be adjusted continuously, there are an infinite number of operating conditions. This data sheet addresses three discrete operating conditions in the Specifications tables. Many other combinations of input and output voltage are possible; Figure 15 depicts the supported voltage combinations at room temperature. Figure 15 was generated by fixing the V_{ISO} load and decreasing the input voltage until the PWM was at 80% duty cycle. Each of the curves represents the minimum input voltage that is required for operation under this criterion. For example, if the application requires 30 mA of output current at 5 V, the minimum input voltage at V_{DDP} is 4.25 V. Figure 15 also illustrates why the $V_{DDP} = 3.3$ V input and $V_{ISO} = 5$ V configuration is not recommended. Even at 10 mA of output current, the PWM cannot maintain less than 80% duty factor, leaving no margin to support load or temperature variations.

Typically, the ADuM6210/ADuM6211/ADuM6212 dissipates about 17% more power between room temperature and maximum temperature; therefore, the 20% PWM margin covers temperature variations.

The ADuM6210/ADuM6211/ADuM6212 implement undervoltage lockout (UVLO) with hysteresis on the primary and secondary side I/O pins as well as the V_{DDP} power input. This feature ensures that the converter does not go into oscillation due to noisy input power or slow power-on ramp rates.

PCB LAYOUT

The ADuM6210/ADuM6211/ADuM6212 digital isolators with 0.15 W *isoPower* integrated dc-to-dc converters require no external interface circuitry for the logic interfaces. Power supply bypassing with a low ESR capacitor is required, as close to the chip pads as possible. The *isoPower* inputs require several passive components to bypass the power effectively as well as set the output voltage

and bypass the core voltage regulator (see Figure 24 through Figure 26).

Figure 24. V_{DDP} Bias and Bypass Components

Figure 25. V_{ISO} Bias and Bypass Components

The power supply section of the ADuM6210/ADuM6211/ADuM6212 uses a 125 MHz oscillator frequency to efficiently pass power through its chip-scale transformers. Bypass capacitors are required for several operating frequencies. Noise suppression requires a low inductance, high frequency capacitor; ripple suppression and proper regulation require a large value bulk capacitor. These capacitors are most conveniently connected between Pin 9 and Pin 10 for V_{DDP} and between Pin 11 and Pin 12 for V_{ISO} . To suppress noise and reduce ripple, a parallel combination of at least two capacitors is required. The recommended capacitor values are 0.1 µF and 10 µF for V_{DDP} . The smaller capacitor must have a low ESR; for example, use of an NPO or X5R ceramic capacitor is advised. Ceramic capacitors are also recommended for the 10 µF bulk capacitance. An additional 10 nF capacitor can be added in parallel if further EMI reduction is required.

Note that the total lead length between the ends of the low ESR capacitor and the input power supply pin must not exceed 2 mm.

Figure 26. Recommended PCB Layout

In applications involving high common-mode transients, ensure that board coupling across the isolation barrier is minimized. Furthermore, design the board layout such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this can cause voltage differentials between pins, exceed-

APPLICATIONS INFORMATION

ing the absolute maximum ratings specified in Table 20, thereby leading to latch-up and/or permanent damage.

THERMAL ANALYSIS

The ADuM6210/ADuM6211/ADuM6212 consist of four internal die attached to a split lead frame with two die attach paddles. For the purposes of thermal analysis, the chip is treated as a thermal unit, with the highest junction temperature reflected in the θ_{JA} from Table 15. The value of θ_{JA} is based on measurements taken with the devices mounted on a JEDEC standard, 4-layer board with fine width traces and still air. Under normal operating conditions, the ADuM6210/ADuM6211/ADuM6212 can operate at full load across the full temperature range without derating the output current.

PROPAGATION DELAY PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component (see Figure 27). The propagation delay to a logic low output may differ from the propagation delay to a logic high.

Figure 27. Propagation Delay Parameters

Pulse width distortion is the maximum difference between these two propagation delay values and is an indication of how accurately the input signal timing is preserved.

Channel-to-channel matching refers to the maximum amount the propagation delay differs between channels within a single ADuM6210/ADuM6211/ADuM6212 component.

Propagation delay skew refers to the maximum amount the propagation delay differs between multiple ADuM6210/ADuM6211/ADuM6212 devices operating under the same conditions.

EMI CONSIDERATIONS

The dc-to-dc converter section of the ADuM6210/ADuM6211/ADuM6212 components must, of necessity, operate at a very high frequency to allow efficient power transfer through the small transformers. This creates high frequency currents that can propagate in circuit board ground and power planes, causing edge and dipole radiation. Grounded enclosures are recommended for applications that use these devices. If grounded enclosures are not possible, follow good RF design practices in the layout of the PCB. See the AN-0971 Application Note for the most current PCB layout recommendations for the ADuM6210/ADuM6211/ADuM6212.

DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow (~1 ns) pulses to be sent to the decoder via the transformer.

The decoder is bistable and is, therefore, either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than 1.6 μ s, periodic sets of refresh pulses that are indicative of the correct input state are sent to ensure dc correctness at the output. If the decoder receives no internal pulses of more than approximately 6.4 μ s, the input side is assumed to be unpowered or nonfunctional, in which case, the isolator output is forced to a default low state by the watchdog timer circuit. This situation should occur in the ADuM6210/ADuM6211/ADuM6212 only during power-up and power-down operations.

The limitation on the ADuM6210/ADuM6211/ADuM6212 magnetic field immunity is set by the condition in which induced voltage in the transformer receiving coil is sufficiently large to either falsely set or reset the decoder. The following analysis defines the conditions under which this can occur. The 3.3 V operating condition of the ADuM6210/ADuM6211/ADuM6212 is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude of >1.5 V. The decoder has a sensing threshold of about 0.5 V, thus establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt)\sum\pi r_n^2; n = 1, 2, \dots, N \tag{2}$$

where:

β is the magnetic flux density (gauss).

r_n is the radius of the n^{th} turn in the receiving coil (cm).

N is the number of turns in the receiving coil.

Given the geometry of the receiving coil in the ADuM6210/ADuM6211/ADuM6212 and an imposed requirement that the induced voltage be, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 28.

Figure 28. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is about 50% of the sensing threshold and

APPLICATIONS INFORMATION

does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse (and is of the worst-case polarity), it reduces the received pulse from >1.0 V to 0.75 V, which is still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances from the ADuM6210/ADuM6211/ADuM6212 transformers. Figure 29 expresses these allowable current magnitudes as a function of frequency for selected distances. As shown in Figure 29, the ADuM6210/ADuM6211/ADuM6212 are extremely immune and can be affected only by extremely large currents operated at high frequency very close to the component. For the 1 MHz example, a 0.5 kA current, placed 5 mm away from the ADuM6210/ADuM6211/ADuM6212, is required to affect component operation.

Figure 29. Maximum Allowable Current for Various Current-to-ADuM621x Spacings

Note that, in combinations of strong magnetic field and high frequency, any loops formed by PCB traces can induce error voltages that are sufficiently large to trigger the thresholds of succeeding circuitry. Exercise care in the layout of such traces to avoid this possibility.

POWER CONSUMPTION

The VDDP power supply input provides power only to the converter. Power for the data channels is provided through VDD1 and VDD2. These power supplies can be connected to VDDP and VISO, if desired; or the supplies can receive power from an independent source. The converter should be treated as a standalone supply to be utilized at the discretion of the designer.

The V_{DD1} or V_{DD2} supply current at a given channel of the ADuM6210/ADuM6211/ADuM6212 isolator is a function of the supply voltage, the data rate of the channel, and the output load of the channel.

For each input channel, the supply current is given by

$$I_{DDI} = I_{DDI(Q)} \quad f \leq 0.5 f_r \quad (3)$$

$$I_{DDI} = I_{DDI(D)} \times (2f - f_r) + I_{DDI(Q)} \quad f > 0.5 f_r \quad (4)$$

For each output channel, the supply current is given by

$$I_{DDO} = I_{DDO(Q)} \quad f \leq 0.5 f_r \quad (5)$$

$$I_{DDO} = (I_{DDO(D)} + (0.5 \times 10^{-3}) \times C_L \times V_{DDO}) \times (2f - f_r) + I_{DDO(Q)} \quad f > 0.5 f_r \quad (6)$$

where:

$I_{DDI(D)}$, $I_{DDO(D)}$ are the input and output dynamic supply currents per channel (mA/Mbps).

$I_{DDI(Q)}$, $I_{DDO(Q)}$ are the specified input and output quiescent supply currents (mA).

f is the input logic signal frequency (MHz); it is half the input data rate, expressed in units of Mbps.

f_r is the input stage refresh rate (Mbps).

C_L is the output load capacitance (pF).

V_{DDO} is the output supply voltage (V).

To calculate the total V_{DD1} and V_{DD2} supply current, the supply currents for each input and output channel corresponding to V_{DD1} and V_{DD2} are calculated and totaled. Figure 18 and Figure 19 show per-channel supply currents as a function of data rate for an unloaded output condition. Figure 20 shows the per-channel supply current as a function of data rate for a 15 pF output condition. Figure 21 through Figure 23 show the total V_{DD1} and V_{DD2} supply current as a function of data rate for ADuM6210/ADuM6211/ADuM6212 channel configurations.

INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation. Analog Devices conducts an extensive set of evaluations to determine the lifetime of the insulation structure within the ADuM6210/ADuM6211/ADuM6212.

Accelerated life testing is performed using voltage levels that are higher than the rated continuous working voltage. Acceleration factors for several operating conditions are determined, allowing calculation of the time to failure at the working voltage of interest. The values shown in Table 21 summarize the maximum continuous working voltages as per IEC 60747-17. Operation at working voltages that are higher than the service life voltage listed leads to premature insulation failure.
