Click here to ask an associate for production status of specific part numbers.

Evaluates: MAX34460A

MAX34460A Evaluation Kit

General Description

The MAX34460A evaluation kit (EV kit) provides the hardware and software graphical user interface (GUI) necessary to evaluate the MAX34460A PMBus™ 12-channel voltage monitor and sequencer. The EV kit includes a MAX34460AA00+ installed, as well as four power supplies that can be sequenced, monitored, and margined by the IC.

EV Kit Contents

- Assembled Circuit Board Including MAX34460AA00+
- Mini-USB Cable

***Ordering Information* appears at end of data sheet.**

Features

- Easy Evaluation of the MAX34460A
- Four Power-Supply Channels
- EV Kit Hardware is USB Powered (USB Cable Included)
- USB HID Interface
- Windows® 10-Compatible Software
- RoHS Compliant
- Proven PCB Layout
- Fully Assembled and Tested

MAX34460A EV Kit Files

FILE	DESCRIPTION
MAX344XXEVKitSoftware.EXE	Application program

Note: *The .EXE file is downloaded as a .ZIP file.*

Quick Start

Required Equipment

- MAX34460A EV kit and hardware
- Windows 10 PC
- USB port
- Mini-USB cable (included)

Note: In the following sections, software-related items are identified by bolding. Text in **bold** refers to items directly from the install or EV kit software. Text in **bold and underlined** refers to items from the Windows operating system.

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

1) Ensure that jumpers/shunts J23 and J1 are installed. **Note:** The GND planes of the USB I²C dongle and the EV kit are not connected. The GND jumper on J23 must be connected for proper communication.
2) Ensure that switches S1 and S2 are in the high position and S4–S6 are in the on position.
3) Set the EV kit hardware on a nonconductive surface to ensure that nothing on the PCB gets shorted together.
4) Prior to starting the GUI, connect the EV kit hardware to a PC using the supplied Mini-USB cable, or equivalent. The power LED (D20) should be green and the com LED (D21) should be red and slowly flash orange.
5) Windows should automatically begin installing the necessary device driver. The USB interface of the EV kit hardware is configured as an HID device and therefore does not require a unique/custom device driver. Once the driver installation is complete, a Windows message appears near the **System Icon** menu indicating that the hardware is ready to use. Do not attempt to run the GUI prior to this message. If you do, then you must close the application and restart it once the driver installation is complete. On some versions of Windows, administrator privileges may be required to install the USB device.
6) Once the device driver installation is complete. Visit www.analog.com/en/resources/evaluation-hardware-and-software/software.html to download the latest version of the EV kit software, and click on **MAX344XXEVKitSoftware**.
7) Open the .ZIP file and double-click on the .EXE file to run the installer. A message box stating: **The publisher could not be verified. Are you sure you want to run this software?** may appear. If so, click **Yes**.
8) The installer GUI appears. Click **Next** and then **Install**. Once complete, click **Close**.
9) Go to **Start | All Programs**. Look for the **MAX344XXEVKitSoftware** folder and click on the MAX34460EVKitSoftware.EXE file inside the folder.
10) When the GUI appears, the text at the bottom should display **EV Kit Hardware Connected**. The com LED (D21) on the EV kit board should turn green.

Detailed Description of Software

Software Startup

If the MAX34460A EV kit is connected when the software is opened, the software first initializes the hardware to communicate. Next, the software searches for all slave addresses on the I²C bus and connects to the first slave address that is valid. The model number is then read to see which device is connected. The GUI displays **EV Kit Hardware Connected** at the bottom.

If the EV kit is not connected on software startup, a **No Hardware** window pops up and asks the user to select the device they would like to run offline. Select a device and click **OK**. The GUI then populates with default EV kit values. Once the EV kit is connected, the GUI executes the sequence above.

Menu Items

The **File** menu item contains save, load, and exit options. To save the current GUI configuration, click **Save Project As**. This saves the device name and channel names to an XML file and saves PMBus configurations to a HEX file. If a device is connected, this reads and saves data directly from the device; otherwise, it saves the configuration that is currently displayed on the GUI. **Save Project**

saves the GUI configuration to a file that was last saved or loaded. **Load Project** updates the GUI with the XML file, writes the HEX file to the device, and reads current values from the device. If a device is not connected, then the HEX file is written to a virtual device. The HEX file only contains data for the PMBus commands that are stored in flash. **Create Report** saves a CSV file that contains all the tables displayed on the **Sequencing**, **Monitoring**, and **Margining** tabs.

The **Connection** menu item allows the user to connect to a desired device. **Find Slave Addresses** searches for all slave addresses connected to the I²C bus. To select a device, click **Select Slave Address** and all the slave addresses found are shown and are selectable. Slave addresses 18h and 34h are not selectable to prevent communicating with the alert response address and factory-programmed address.

The **Auto Polling** menu item has options for automatic reading of the device. To start polling, select the delay between reads: **300ms**, **500ms**, **800ms**, or **1000ms**. Each poll reads the **Power Status** (STATUS_WORD, 79h), **Fault Status** (STATUS_WORD, 79h), and the polled values for the **Data Log Graph** tab. The **Status** and **Margining** tabs are only polled if the tab is currently selected. To stop polling, select **Off** from the menu. Polling can also be stopped by selecting items in the **File** menu, **Connection** menu, or by pressing buttons that involve action with the NV Fault Log or flash.

The **Device** menu item shows which device the tables and controls are configured for. To turn the power supplies on or off, select the **Power On**/**Power Off** button, which writes a value to the OPERATION (01h) command. The supplies power on with margining off and power off based on the **Power Down Action** drop-down list on the **Sequencing** tab. When the **GUI Lock** is on, all writing actions are disabled.

The version of the GUI software and the device firmware can be checked by clicking the **About** option in the **Help** menu item on the status bar.

Status Log

The status log below the tabs displays all the actions the GUI performs. Whenever a PMBus command is read or written, the action is confirmed by the log. To save the log, press the **Save Log** button and the text in the box is saved to a .TXT file. The log can also be cleared by pressing the **Clear Log** button.

Sequencing Tab

The **Sequencing** tab sheet (Figure 1) includes all timing and alarm configurations. All values on the tab are read when the tab is selected. The channels can be set up in one or two groups by selecting the **Single** or **Dual** radio button under **Sequencing Mode**. When **Single** is selected, the **Group** column is forced to **Primary**. The channels can also be sequenced based on time or event by selecting the option from the **Sequencing Mode** drop-down list. If **PMBus (time-based)** is chosen, then the values under the **Timeslot** (MFR_SEQ_TIMESLOT, D3h) column are all written to 0. The **Sequencing Mode** radio buttons and drop-down lists write to bits in MFR_MODE (D1h). The channels can be powered down simultaneously or with a TOFF delay by selecting the option in the **Power Down Action** drop-down list that writes to a bit in ON_OFF_CONFIG (02h). The **Fault Retry Time** sets the value in MFR_FAULT_RETRY (DAh). The **Output Type** writes to MFR_PSEN_CONFIG (D2h) to set the PSEN behavior. For the PSEN pin to act as a normal enable/disable for a power supply, select one of the PSEN options under **Output Type**. If a GPO option is selected, the channel is no longer a part of the sequencer, so the **Timeslot** and **TON Max** are written to 0 and all the channel configurations on the table become read-only. The timeslot for each channel can be set by selecting a value in the **Timeslot** column, which writes to MFR_SEQ_TIMSLOT (D3h). Note that these values can only be changed when the **Sequencing Mode** is set to **Timeslot (event-based)**. The **Group** column assigns the channel to the primary or secondary group by writing to a bit in MFR_SEQ_TIMESLOT (D3h). The sequencing delays can be set by writing values to **TON Delay** (TON_DELAY, 60h), **TON Max** (TON_MAX_FAULT_LIMIT, 62h), and **TOFF Delay** (TOFF_DELAY, 64h). A channel can be set to global by checking the checkbox in the **Global** column to write to a bit in MFR_FAULT_RESPONSE (D9h). Alarm 0 and Alarm 1 can be configured to turn on for different faults by selecting an option in the **ALARM0/1 Pin Config** column that writes to bits in MFR_FAULT_RESPONSE (D9h). The **Fault Response** column writes to the TON Max Fault response bits in MFR_FAULT_RESPONSE (D9h). To log faults into the NV fault log, check the checkbox in the **Log Faults** column that writes to MFR_FAULT_RESPONSE (D9h).

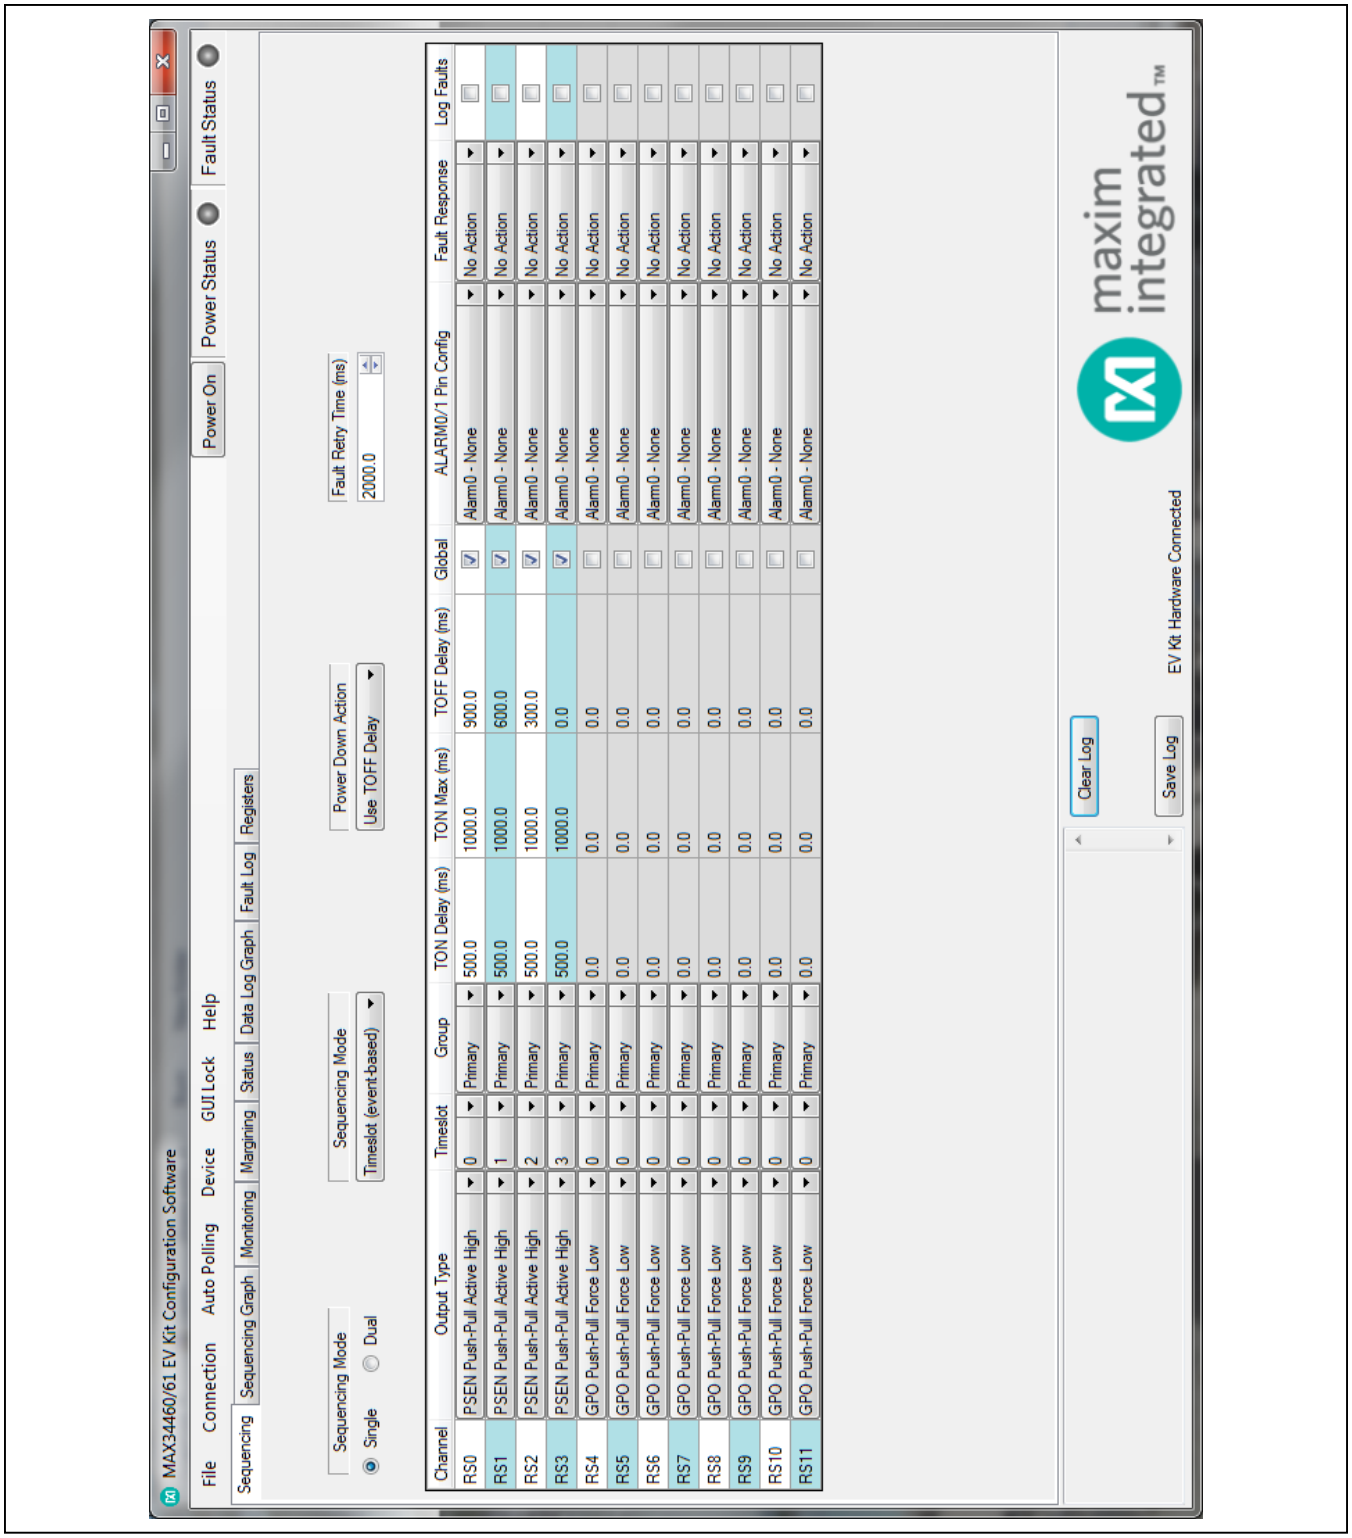

Figure 1. MAX34460A EV Kit GUI (Sequencing Tab)

Sequencing Graph Tab

The **Sequencing Graph** tab sheet (Figure 2) displays the timing diagrams for all the channels. When the **Power Up** radio button is selected, the **TON Delay** (TON_DELAY, 60h) and **TON Max** (TON_MAX_FAULT_LIMIT, 62h) values are displayed on the graph. To change the **TON Delay**, click and drag the green vertical bar; to change **TON Max**, click and drag the red vertical bar. The **Power Down** graph displays the **TOFF Delay** (TOFF_DELAY, 64h) and can be changed by clicking and dragging the green vertical bar. These values write to the PMBus command when the mouse is released. The **Power Up** graph can be changed to **PMBus (time-based)** or **Timeslot (event-based)** by selecting the option on the **Sequencing** tab (Figure 1). When **Timeslot (event-based)** is selected, the power-up graph allows the **Timeslot** (MFR_SEQ_TIMSLOT, D3h) to be changed by clicking and dragging the ramp.

Monitoring Tab

The **Monitoring** tab sheet (Figure 3) displays the fault/warn limit settings for each channel and for each temperature sensor. To read the settings, click on the **Monitoring** tab and all the values are automatically read. To write to a value, click on the corresponding cell, type in a valid value, and either click another cell or press Enter on the keyboard. In the **VOLTAGE** table, the **Sequencer** column shows the status of the channel and is read only. To turn on or off the sequencer, select a PSEN or GPO option, respectively, on the **Sequencing** tab (Figure 1) under the **Output Type** column. The **Nominal** and **Resistive Ratio** columns are calculated based on a nominal ADC level of 1.8V to set the VOUT_SCALE_MONITOR (2Ah). The **Resistive Ratio** is found by dividing 1.8V by the **Nominal** value. The fault/warn limits can be set by entering the voltage level or the percent of the nominal in the **UV Fault** (VOUT_UV_FAULT_LIMIT, 44h), **UV Warn** (VOUT_UV_WARN_LIMIT, 43h), **OV Warn** (VOUT_OV_WARN_LIMIT, 42h), **OV Fault** (VOUT_OV_FAULT_LIMIT, 40h), **PG On** (POWER_GOOD_ON, 5Eh), and **PG Off** (POWER_GOOD_OFF, 5Fh) columns. The **Fault Response** column writes to the OV and UV fault response bits in MFR_FAULT_RESPONSE (D9h). To write to the OT fault response bits in MFR_FAULT_RESPONSE (D9h), check the checkbox in the **OT Fault** column and it sets the same response selected in the **Fault Response** column. To log faults into the NV fault log, check the checkbox in the **Log Faults** column to write to MFR_FAULT_REPSPONSE (D9h). In the **TEMPERATURE** table, the sensors can be enable/disabled in the **Enable** column, which writes to a bit in MFR_TEMP_SENSOR_CONFIG (F0h). The OT warn/fault limits can be set by entering a value in the **OT Warn** (OT_WARN_LIMIT, 51h) or **OT Fault** (OT_FAULT_LIMIT, 4Fh) columns.

The power-good delay can be adjusted with the **PG Delay** up/down spin box, which writes to MFR_PG_DELAY (DBh). The **Watchdog Configuration** section sets up the external watchdog and reads/writes to bits in MFR_WATCHDOG_CONFIG (FDh).

Margining Tab

The **Margining** tab sheet (Figure 4) includes the margin configurations, margin fault status, and a DAC calculator for the DS4424. All values on the tab are read when the tab is selected. The **Margin** column turns the margin on/off by writing to the OPERATION (01h) command. To force all the channels to the same margin, select the state in the **Margin All Control** drop-down list to the right of the table. The **Slope**, **Open Loop**, and **DAC Value** columns configure the DS4424 and are read from bits in the MFR_MARGIN_CONFIG (DFh) command. The margining limits can be set by entering the voltage level or the percent of the nominal in the **Margin Low** (VOUT_MARGIN_LOW, 26h) and **Margin High** (VOUT_MARGIN_HIGH, 25h) columns. When the margining is turned on, the fault status is shown in the **Status** column read from STATUS_MFR_SPECIFIC (80h). The **Polled** column displays the current channel voltage read from READ_VOUT (8Bh). To read the **Status** and **Polled** values, press the **Read Status and Vout** button or turn on **Auto Polling**. The margin fault can be cleared by pressing the **Clear Faults** button on the **Status** tab (Figure 5).

The **Calculator** is used to find the DS4424 external resistor (R_{FS}), which determines the full-scale and step-size current for the DAC. If R_{FS} is calculated to be outside its limits (40kI < R_{FS} < 160kI), then the resistor is forced to the edge of the limit and the **DS4424 RFS** edit box turns red. The equations used to calculate the outputs are given in Table 1.

Table 1. DAC Calculator

OUTPUT EQUATIONS
$I_{FB} = (V_{OUT})/(R1 + R2)$
DS4424 RFS = (7.75)/(I_{FB} x margining range)
DS4424 full scale = (0.976 x 127)/(16 x R_{FS})
DS4424 step size = full scale/64

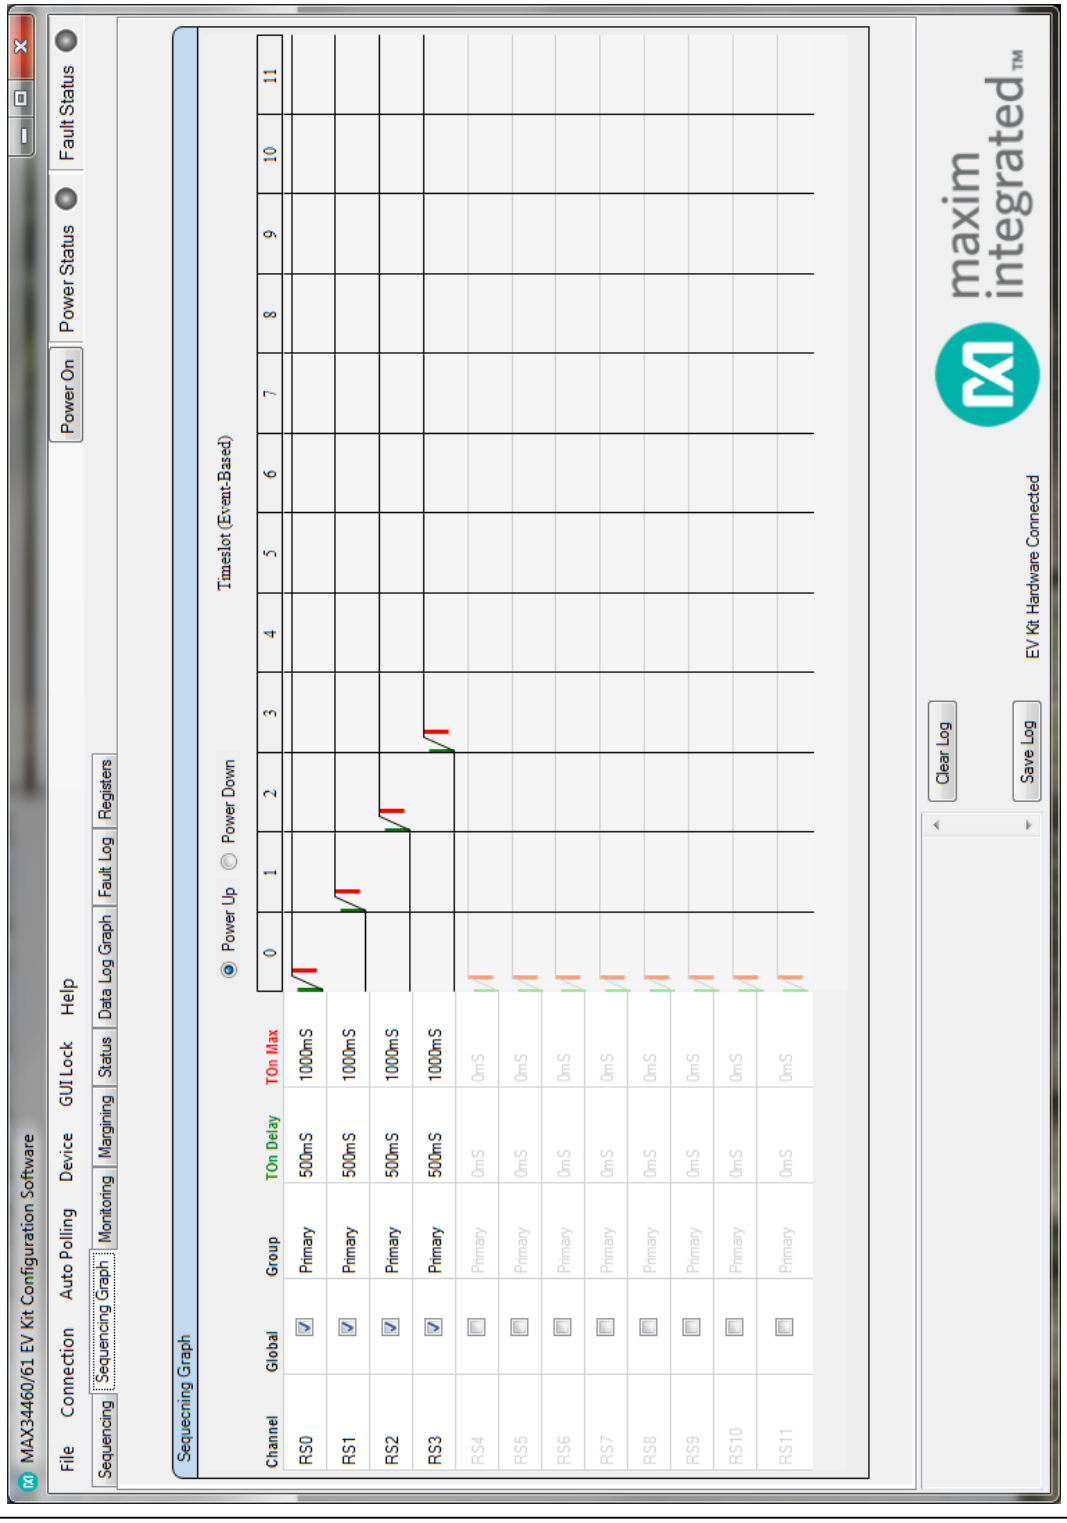

Figure 2. MAX34460A EV Kit GUI (Sequencing Graph Tab)

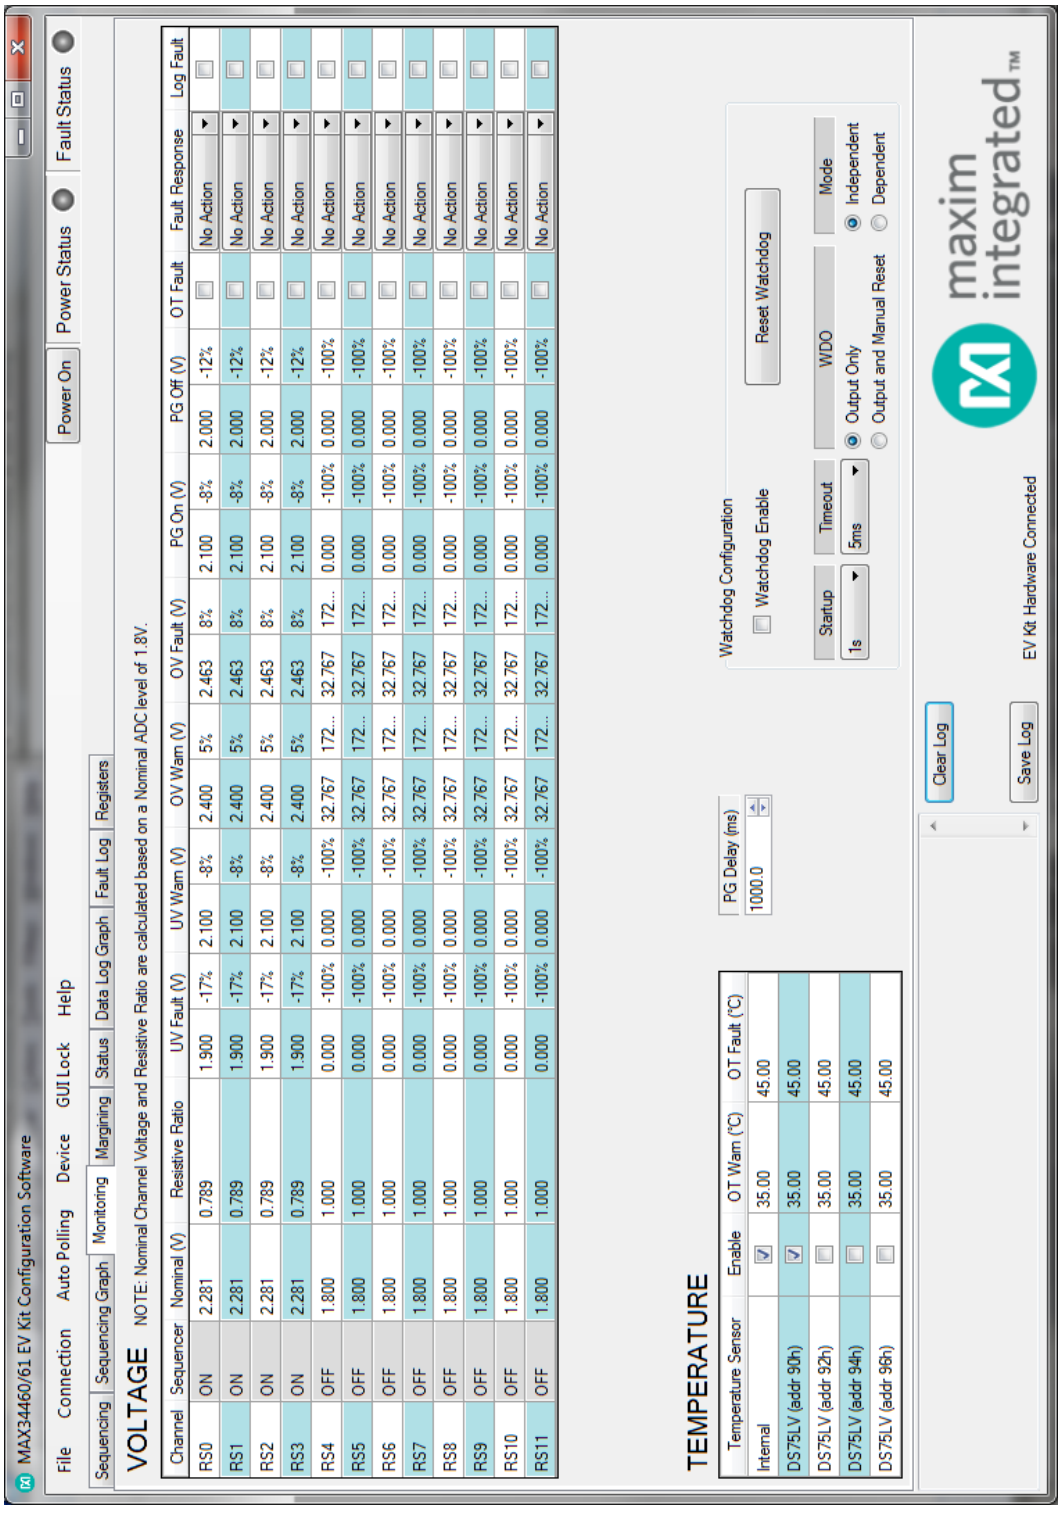

Figure 3. MAX34460A EV Kit GUI (Monitoring Tab)

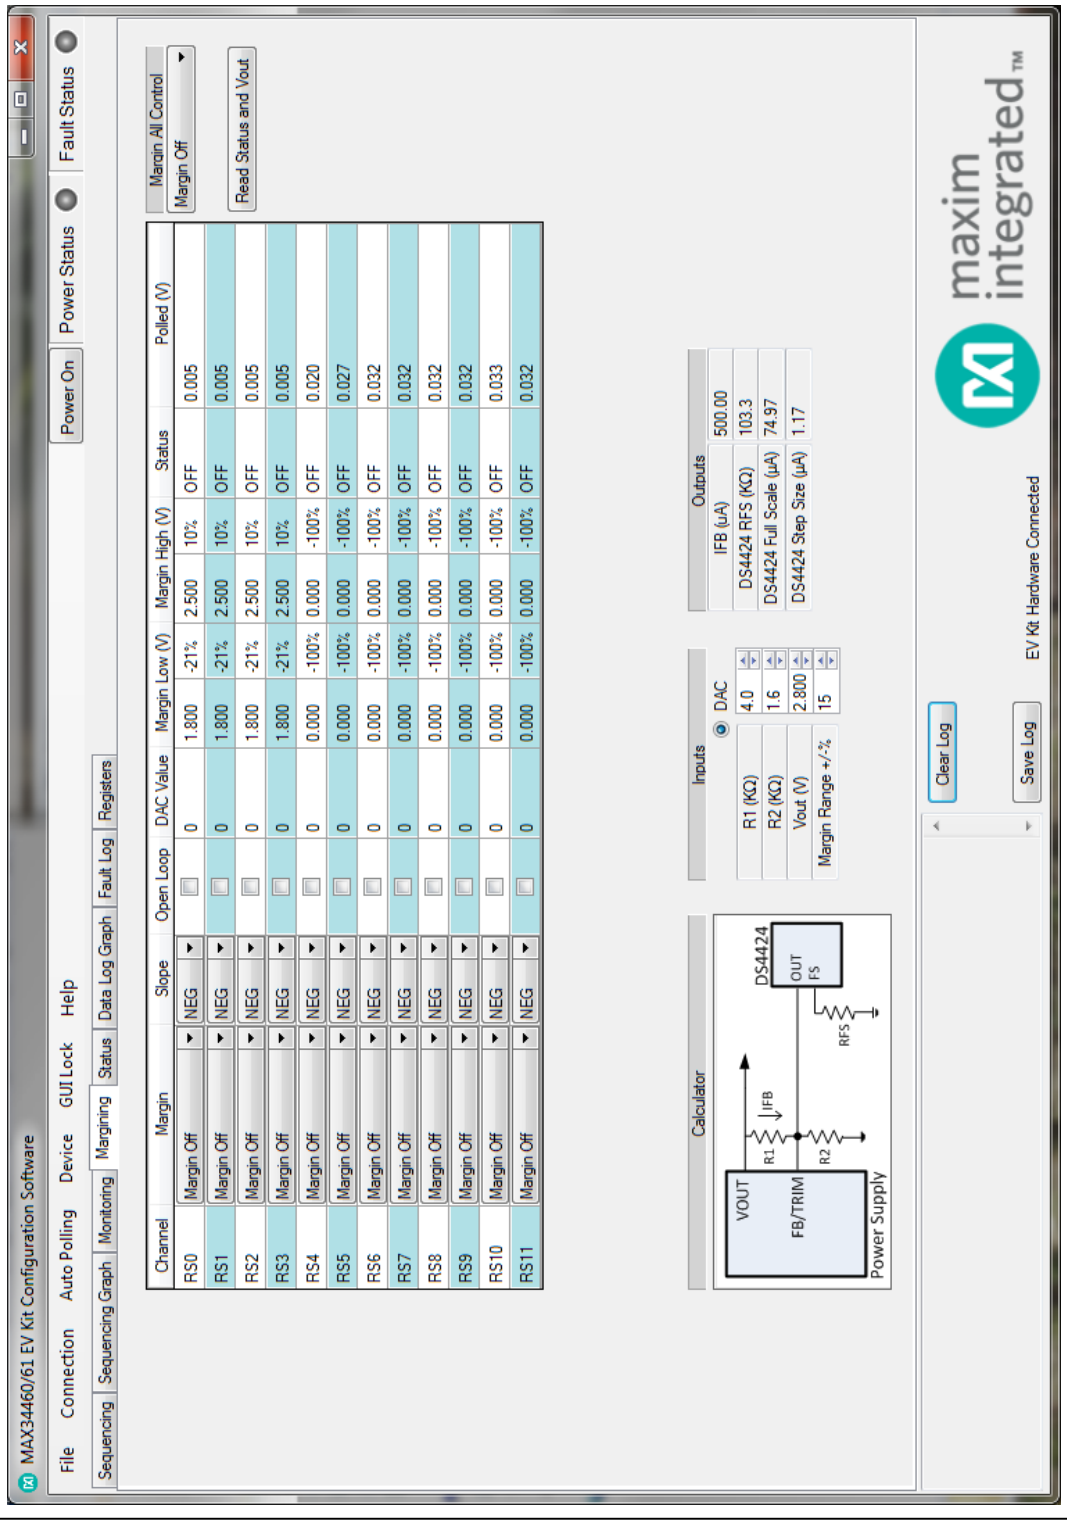

Figure 4. MAX34460A EV Kit GUI (Margining Tab)

Status Tab

The **Status** tab sheet (Figure 5) displays all the faults, warnings, and device ID information. To read all the current output values, faults, and warnings, press the **Read Status** button or turn on **Auto Polling**. The fault and warning bits are read from STATUS_VOUT (7Ah), STATUS_MFR_SPECIFIC (80h) and STATUS_TEMPERATURE (7Dh). The **Polled** values are read from READ_VOUT (8Bh) and READ_TEMPERATURE (8Dh). Each color indicator turns green if the status is good, red if there is a fault, or yellow to indicate a warning. The **Polled** value may not reflect the fault or warning because some bits are latches and have to be cleared. To clear the faults and warnings, press the **Clear Faults** button, which sends the CLEAR_FAULTS (03h) command. The alarm faults are also latches and have to be cleared by pressing the **Clear Alarm** button to set a bit in MFR_MODE (D1h). The **Time Count** displays the 32-bit counter read from the MFR_TIME_COUNT (DDh) command. This timer can be reset by pressing the **Reset Time Count** button, which writes a sequence of all zeros, all ones, and all zeros to MFR_TIME_COUNT (DDh). The **ID COMMANDS** table displays all the ID information of the device. Press the **Read ID** button to read all the commands in the table.

Data Log Graph Tab

The **Data Log Graph** tab sheet (Figure 6) plots the polled values in a graph and keeps track of the minimum and maximum values for each channel voltage and each temperature sensor. To read and plot the polled values, press the **Data Log Read** button or turn on **Auto Polling**. Each data log reads every channel's voltage from READ_VOUT (8Bh) and every temperature sensor from READ_TEMPERATURE (8Dh). The software finds the minimum and maximum values over multiple reads. The **Poll Count** displays the number of reads that have been tracked in the data log. When the polled count reaches 10,000, the graph deletes the oldest polled values and adds a new polled value. The min/max values are still based on all the poll count values, but the graph only displays the latest 10,000 polled values. To reset the **Poll Count** and all the minimum and maximum values, press the **Data Log Reset** button. To turn off data logging during polling, check the **Data Log Off** checkbox. The **Select Data** combo box is used to select the voltage or temperature data to display on the graph and in the **MIN/MAX Data** table. To save all the data graphed to a CSV file, press the **Save Data Log** button.

Fault Log Tab

The **Fault Log** tab sheet (Figure 7) displays the **NV Fault Log** and fault configurations. When the tab is selected, the **Overwrite** and **Fault Log Depth** are read. When the fault log is full, the **Enable Overwrite** can be checked to automatically overwrite previous logs. The fault log depth can be adjusted with the **Fault Log Depth** combo box. The **Enable Overwrite** and **Fault Log Depth** are read from bits in MFR_NV_LOG_CONFIG (D8h). To read the fault log, press the **Read NV Fault Log** button and all 255 bytes from MFR_NV_FAULT_LOG (DCh) are displayed in the table. To clear or force the fault log, press the **Clear NV Fault Log** or **Force NV Fault Log** button, respectively. These buttons write to a bit in MFR_NV_LOG_CONFIG (D8h). To save the current fault log displayed in the table, press the **Dump to a File** button and the table is saved as a CSV file.

Registers Tab

The **Registers** tab sheet (Figure 8) displays all the PMBus commands and their current data. To read the registers, select a page from the top drop-down list and all the PMBus commands valid for that page are automatically read. The commands not valid for that page are grayed out. Press the **Read All** button to read the registers again. To write to a command, enter the hex value in the cell and click another cell or press Enter on the keyboard. The current register configuration can be saved to flash by pressing the **Save to Flash** button, which sends the STORE_DEFAULT_ALL (11h) command. To return the device to the configuration saved in flash, press the **Restore from Flash** button, which sends the RESTORE_DEFAULT_ALL (12h) command. To reset the device, press the **Soft Reset** button to write to a bit in MFR_MODE (D1h). The **Calculate CRC** button sends the RESTORE_DEFAULT_ALL (12h) command and then calculates a 2-byte CRC based on PMBus configuration commands that are stored in flash. The **Read CRC from MFR_DATE** button reads MFR_DATE (9Dh) and displays the upper 2 bytes in the edit box below the button. The **Calculate CRC & Write to MFR_DATE** button sends the RESTORE_DEFAULT_ALL (12h) command, calculates a CRC, writes the CRC to the upper 2 bytes of MFR_DATE (9Dh), and sends STORE_DEFAULT_ALL (11h) command. The **Command Description** displays the bitmap for selected PMBus commands. Select the command from the drop-down list and the table below displays a description of each bit for that command.

Detailed Description of Hardware

User-Supplied I²C Interface

To communicate with the MAX34460A using a user-supplied I²C interface, first remove the J23 jumper to disconnect the USB I²C dongle. If the dongle is no longer desired, it can be separated from the EV kit by snapping the PCB at the scored line. Connect test points SDA, SCL, GND, and 5V to the off-board I²C interface. The I²C interface should operate at 3.3V.

User-Supplied Power Supplies

To disconnect the on-board power supplies, turn the DAC (S4), RS (S5), and PSEN (S6) DIP switches off. The power supplies' GND should be connected to the banana jack GND. Connect the desired PSEN pins to the enable pin on the power supply, and the RS pins to a voltage-divider on the output of the power supply. The voltage-divider is only required if the output voltage is greater than 1.8V. For closed-loop margining with the on-board DS4424, connect DAC0–DAC3 to the feedback of the power supply channels 0–3.

User-Supplied DS4424

To margin with a user-supplied DS4424, disconnect the on-board current DAC by switching the DAC (S4) DIP switch to off. Then connect MSDA, MSCL, and GND on J3 to the external current DAC. The slave address for the user-supplied DS4424 should be 60h for power-supply channels 4–7 or A0h for channels 8–11. The on-board DS4424 has slave address 20h, which margins channels 0–3.

User-Supplied DS75LV

To use an off-board digital temperature sensor, connect MSDA, MSCL, and GND on J3 to the DS75LV. The slave address for the user-supplied DS75LV should be 92h, 94h, or 96h. The on-board DS75LV has slave address 90h.

Troubleshooting

All efforts were made to ensure that each kit works on the first try, right out of the box. In the rare occasion that a problem is suspected, see Table 5 to help troubleshoot the issue.

Table 2. Description of LEDs

LED	COLOR	DESCRIPTION
D2	Red	Fault: A shutdown fault occurred for a global primary group.
D3	Red	Fault 2: A shutdown fault occurred for a global secondary group.
D4	Red	Watchdog Output (WDO): Watchdog timeout has occurred.
D5	Green	Power Good 2 (PG2): All enabled channels for the secondary group are above their associated power-good-on value.
D6	Green	Power Good (PG): All enabled channels for the primary group are above their associated power-good-on value.
D7	Red	Alert: A fault has occurred.
D8	Red	Alarm1: Configurable on the **Sequencing** tab (Figure 1).
D9	Red	Alarm0: Configurable on the **Sequencing** tab (Figure 1).
DA	Red	VOUT0: Channel 0 is on.
DB	Red	VOUT1: Channel 1 is on.
DC	Red	VOUT2: Channel 2 is on.
DD	Red	VOUT3: Channel 3 is on.
D20 (Power)	Red	USB Power Fault: A fault occurred due to overvoltage limit, current limit, or thermal limit.
	Green	USB Power: USB power supply is on.
D21 (Com)	Red	Communication: After the software has initialized the hardware, the LED flashes red when an I²C command is received.
	Green	Initialized: Hardware has been initialized by software.

Table 3. Description of Switches

SWITCH		SWITCH POSITION	DESCRIPTION
S1		HIGH	Control: Pulls the control pin high.
		LOW	Control: Pulls the control pin low.
S2		HIGH	Control 2: Pulls the control 2 pin high.
		LOW	Control 2: Pulls the control 2 pin low.
S3		Pressed	Reset: Pulls the reset pin low to reset the MAX34460AA00.
S4	1	SHORT	DAC0: Connects DAC0 of DS4424 to FB0 of the channel 0 power supply.
	2	SHORT	DAC1: Connects DAC1 of DS4424 to FB1 of the channel 1 power supply.
	3	SHORT	DAC2: Connects DAC2 of DS4424 to FB2 of the channel 2 power supply.
	4	SHORT	DAC3: Connects DAC3 of DS4424 to FB3 of the channel 3 power supply.
S5	1	SHORT	RS0: Connects RS0 of MAX34460A to the channel 0 power supply.
	2	SHORT	RS1: Connects RS1 of MAX34460A to the channel 1 power supply.
	3	SHORT	RS2: Connects RS2 of MAX34460A to the channel 2 power supply.
	4	SHORT	RS3: Connects RS3 of MAX34460A to the channel 3 power supply.
S6	1	SHORT	PSEN0: Connects PSEN0 of MAX34460A to the channel 0 power supply.
	2	SHORT	PSEN1: Connects PSEN1 of MAX34460A to the channel 1 power supply.
	3	SHORT	PSEN2: Connects PSEN2 of MAX34460A to the channel 2 power supply.
	4	SHORT	PSEN3: Connects PSEN3 of MAX34460A to the channel 3 power supply.

Table 4. Description of Jumpers

JUMPER	JUMPER POSITION	DESCRIPTION
J1	VDD-VDUT	MAX34460AA00 Power: Connects VDD to VDUT (MAX34460A).
J23-J24	5V-5V	5V: Supplies 5V from the USB I²C dongle to the EV kit board.
	SDA-SDA	SDA: Connects SDA from the USB I²C dongle to the MAX34460A SDA.
	GND-GND	GND: Connects GND from the USB I²C dongle to the EV kit board GND.
	SCL-SCL	SCL: Connects SCL from the USB I²C dongle to the MAX34460A SCL.

Table 5. Troubleshooting

SYMPTOM	CHECK	SOLUTION
GUI says hardware not found.	Is the LED labeled D20 red?	If yes, then the electronic fuse (U7) is in a fault state. Inspect for electrical shorts on the PCB and make sure that the PCB is not sitting on a conductive surface.
	Does the LED labeled D21 turn green when the GUI is running?	If not, then exit the GUI and try running it again. If D20 still does not turn green, then exit the GUI and try connecting the USB cable to a different USB port on the PC and wait for a Windows message that states the hardware is ready to use. Run the GUI again.
	Are any of the LEDs illuminated?	If not, then the PCB may not be getting power from the USB. Try a different USB cable or a different USB port.
No slave address found and read/writes fail	Jumper J1	Make sure jumper J1 is installed to power the MAX34460.
	Jumper J23	Make sure 4 jumpers on J23 are installed.
Channels do not turn on	Is there a CONTROL# fault on the Status Tab of the GUI?	Default configuration Control is active high. Make sure S1 and S2 are in the high position
	Is the ALERT LED on and all channel LEDs off?	If so, make sure switch PSEN (S6) is in the on position to connect the PSENs of MAX34460 to the channels.
	Is the ALERT LED on and Channel 0 LED on?	If so, make sure switch RS (S5) is in the on position to connect the power-supply outputs to the MAX34460.
Margining is not working, voltage is not changing	S4	Make sure the DAC (S4) switch is in the on position to connect the DACs from DS4424 to FB of channels 0–3
