

LTM4719
42V Dual Input, Low Noise 150mA Step-Down μ Module Regulator with I²C Battery Health Monitor

General Description

The EVAL-LTM4719-AZ evaluation board features the [LTM[®]4719](#), a 42V dual input, 150mA synchronous buck power μ Module[®] (micromodule) regulator with an integrated battery health monitor and a low-dropout linear regulator. The EVAL-LTM4719-AZ has a wide operating input range of 2.4V to 42V and supports seamless transition between the two separate input power sources. The output has a range of 1V to 4.2V and can source up to 150mA of continuous output current.

The EVAL-LTM4719-AZ also features an EXT_{VCC} jumper (JP3) to V_{BUS} for improved efficiency in some applications. The system can be monitored through $\overline{VALID1}$, $\overline{VALID2}$, $\overline{PRIORITY}$, and PG indicators. There are accurate V_{SET1} and V_{SET2} comparators to program independent undervoltage lockout (UVLO) thresholds. Fault protection features include input UVLO, power good, current limit, and overtemperature protection. The built-in precision coulomb counter supports input voltages from 1.8V to 5.5V and a peak current of up to 100mA. The EVAL-LTM4719-AZ utilizes jumpers to easily program the peak current limit of the coulomb counter from 5mA to 100mA by setting IPK0 (JP4), IPK1 (JP5), and IPK2 (JP6).

Evaluation Board Photo

Figure 1. EVAL-LTM4719-AZ Evaluation Board (Part Marking is Laser Mark)

The EVAL-LTM4719-AZ can be connected directly to a PC at P1 using the DC1613A, Analog Devices I²C/SMBus/PMBus dongle. The LTpowerPlay[®] allows the user to run a graphical user interface (GUI) and configure a battery state of health (SoH) monitor.

Features and Benefits

- Seamless Transition between Inputs
- Compatible with LTpowerPlay
 - Easy to use GUI for the Coulomb Counter
 - Access Coulomb Counter Register Data
- Optional Supercapacitor Balancer

Performance Summary

Specifications are at $T_A = 25^\circ\text{C}$.

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
Input voltage range	V_{IN1}, V_{IN2}	2.4		42	V
Input voltage range for coulomb counter	V_{INC}	2.7		5.5	V
Output voltage	V_{OUT}		1.8		V
Bus voltage	V_{BUS}		2.3		V
Maximum continuous output current per phase			150		mA
Default operating frequency			700		kHz
Efficiency at V_{BUS}	12 V_{IN1} , 2.3 V_{BUS} with 150mA load, EN2 off, Burst Mode [®] operation		78.6		%
Efficiency at V_{OUT}	12 V_{IN1} , 2.3 V_{BUS} , 1.8 V_{OUT} with 150mA load, Burst Mode operation		60.5		%

Quick Start

Required Equipment

- Two power supplies
- One electronic load
- At least four digital multimeters (DMMs)

Optional Equipment

- DC1613A
- PC with the LTpowerPlay software installed

Procedure

The EVAL-LTM4719-AZ evaluation board provides an easy way to evaluate the performance of the LTM4719 μ Module. See [Figure 2](#) for test setup connections and use the following procedure.

1. With power off, ensure that the jumpers are in the proper positions.

JP1	JP2	JP3	JP7	JP8
PWM/SYNC	DIODE	EXTV _{CC}	EN2	EN1
BURST	PRIORITY	OPEN	ON	ON

2. Configure the I_{PEAK} jumpers for your chosen current limit for the coulomb counter. Note that the I_{PEAK} setting is locked at startup.

IPK2 (JP6)	IPK1 (JP5)	IPK0 (JP4)	I_{PEAK} (mA)
0	0	0	5
0	0	1	10
0	1	0	15
0	1	1	20
1	0	0	25
1	0	1	50
1	1	0	75
1	1	1	100

- Before connecting the input supply, loads, and meters, preset the V_{IN1} supply to be between 2.4V and 42V and the V_{INC} supply to be between 2.7V to 5.5V. Preset the load current to 0A.
- With power off, connect the load, input voltage supplies, and meters, as shown in [Figure 2](#).
- Turn on V_{IN1} and V_{INC} . The output voltage should be 1.8V \pm 2%.
- Once the proper output voltages are established, adjust the load current up to 150mA. Observe the seamless transition between input supplies, output voltage regulation, output voltage ripple, and other parameters. If V_{OUT} loses regulation while power is being supplied to V_{INC} , the power supplies should be shut down, and the I_{PEAK} limit should be adjusted.
- Connect the DC1613A dongle from a PC to the P1 connector and configure a battery SoH monitor. See the [LTPowerPlay GUI for the LTM4719 Quick Start Guide](#) for details.

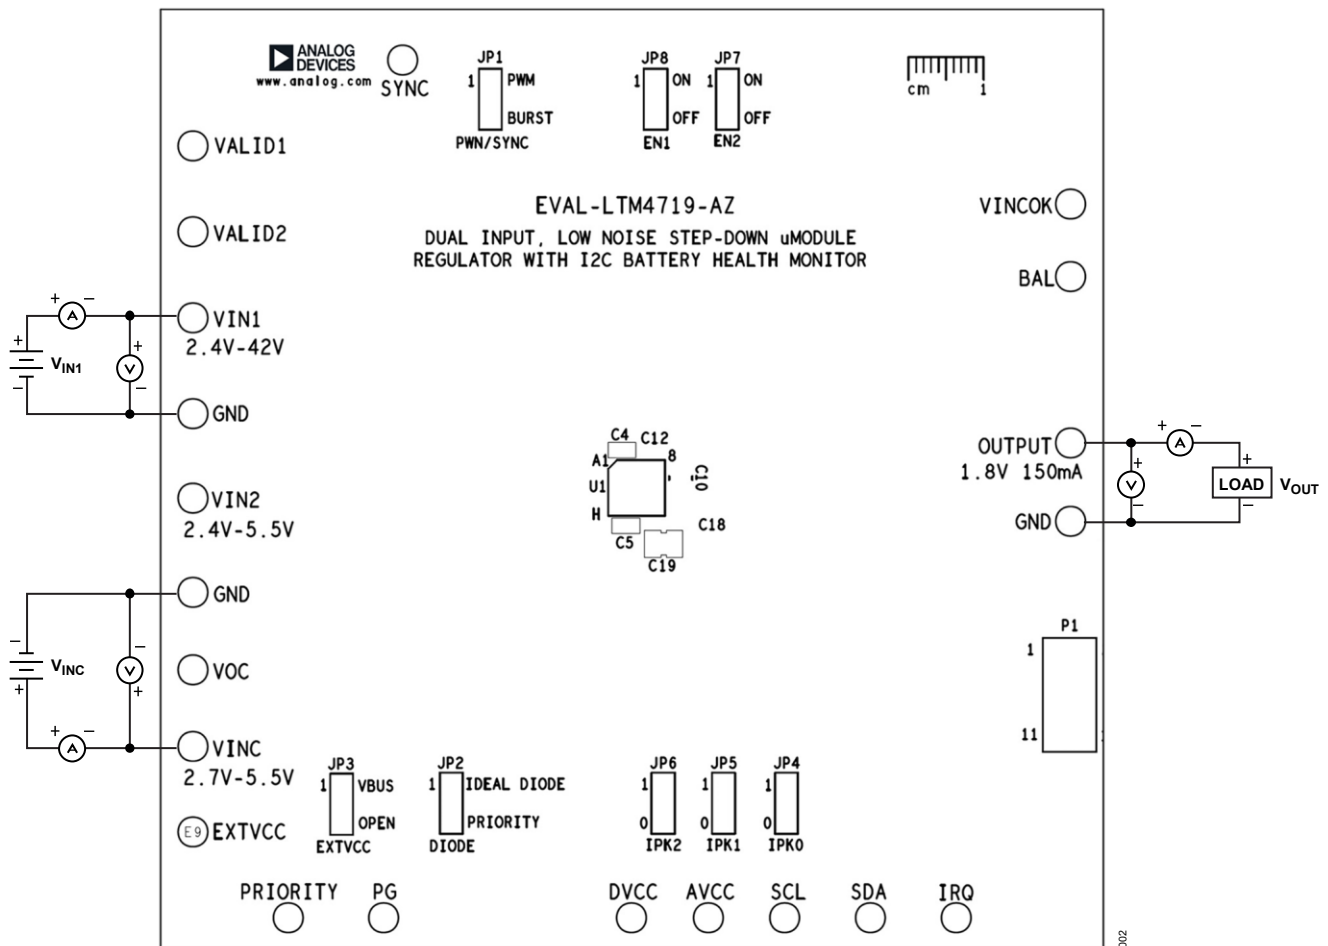

Figure 2. Test Setup of EVAL-LTM4719-AZ

LTpowerPlay Software GUI

The LTpowerPlay is a powerful Windows-based development environment that supports Analog Devices power system management (PSM) ICs, including the LTM4719, LTM4676A, LTC®3880, LTC3883, LTC2974, and LTC2978. The software supports a variety of different tasks. Use the LTpowerPlay to evaluate the Analog Devices ICs by connecting to an evaluation (demo) board system. The LTpowerPlay can also be used in an offline mode (with no hardware present) to build a multichip configuration file that can be saved and reloaded later. The LTpowerPlay provides unprecedented diagnostic and debug features. The LTpowerPlay becomes a valuable diagnostic tool during board bring-up to program or tweak the power management scheme in a system, or to diagnose power issues when bringing up rails. The LTpowerPlay utilizes the DC1613A USB-to-SMBus controller to communicate with one of the many potential targets, including the LTM4719 or a customer board. The software also provides an automatic update feature to keep the software current with the latest set of device drivers and documentation. To access technical support documents for Analog Devices digital PSM products, visit the Help section to access the online help on the LTpowerPlay menu.

LTpowerPlay GUI for the LTM4719 Quick Start Guide

The following procedure describes how to use the LTpowerPlay to configure and monitor the settings of the LTM4719.

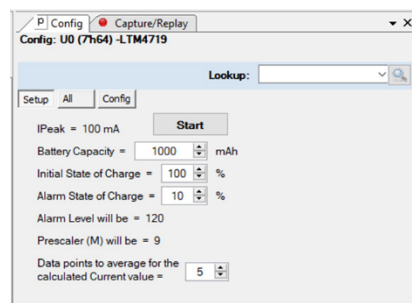

1. Download and install the LTpowerPlay GUI: [LTpowerPlay](#).
2. Ensure the coulomb counter is powered through V_{INC} and adjust the I_{PEAK} settings for your chosen current limit for the coulomb counter. Note that the I_{PEAK} setting is locked at startup.
3. Launch the LTpowerPlay GUI.
 - a. The GUI should automatically identify the EVAL-LTM4719-AZ. The system tree on the left-hand side should look like the following image:

- a. A green message box shows for a few seconds in the lower left-hand corner, confirming that the LTM4719 is communicating.

4. In the Setup tab, configure the settings for your chosen battery. Once finished, **click the Start** button.

5. The coulomb counter is now monitoring the SoH of the battery.

The screenshot displays the software interface for the LTM4719 evaluation board. The interface is divided into several panes:

- Configuration Pane (Left):** Shows the configuration for the U0 (7h64) - LTM4719. Key settings include:
 - CONFIG_SETTINGS (0x7809) Expand for details...
 - PRESCALER_BITS: 9
 - CLEAR_INTERRUPT: Ob: False
 - COUNTER_CHECK: Ob: False
 - COULOMB_COUNTER_SHUTDOWN: Ob: False
 - START_SHUTDOWN_ADC_CONV...: Ob: Off
 - ALARM_LEVEL: 120
 - TEMP_ALARMS (0xFF00) Expand for details...
 - COLO_DIE_TEMP_ALARM_LEVEL: -41.0 °C
 - HOT_DIE_TEMP_ALARM_LEVEL: 158.9 °C
- Telemetry Pane (Middle):** Displays real-time data for the U0-0.
 - Miscellaneous:**
 - BATTERY_STATUS: 99.93 % Expand for ...
 - ACCUM_CHARGE_COUNTER: 26 (0x001A)
 - BATTERY_IMPEDANCE: 1421.2 mOhms
 - AVG_CURRENT: 33.186 mA
 - BATTERY_CAPACITY: 1000.00 mA*hr
 - BATTERY_CHARGE_REMAINING: 999.27 mA*hr
 - BATTERY_PERCENTAGE: 99.93 %
 - STATUS_AND_TEMP (0x48E0) Expand for ...
 - COULOMB_COUNTER_OVERFLOW: Ob: Ok
 - ALARM_TRIP: Ob: Ok
 - ALARM_MIN_TEMP: Ob: Ok
 - ALARM_MAX_TEMP: Ob: Ok
 - ADC_MEASUREMENTS_READY: Ob: False
 - PINSTRAPPED_IPK_PINS: 111b: 100 mA
 - DIE_TEMPERATURE: 17.8 °C
 - Input Voltage:**
 - VIN_PEAK_ON: 4.930 V (0x0025)
 - VIN_PEAK_OFF: 5.072 V (0x0086)
 - Output Voltage:**
 - VOUT_PEAK_ON: 4.791 V (0x00C6)
 - VOUT_PEAK_OFF: 4.874 V (0x00FF)
- Dashboard (Right):** Shows a battery level indicator at 99.93%, a VIN at 5.07 V, and an Average Current of 33.19 mA. It also includes a VIN PEAK_OFF (All Pages in System) section showing 5.072 V (0x0086).
- Telemetry Plot (Bottom Right):** A graph titled 'VIN_PEAK_OFF' showing a signal fluctuating around 5.07 V over time (x-axis from 185 to 200).
